National Coral Reef Ecosystem Assessment Process

National Coral Reef Ecosystem Monitoring Program

Cooperative Monitoring Studies - Meeting Local Management Needs & National Program Requirements

OBJECTIVES:

- 1) Provide leadership in the development and implementation of a national program to monitor US coral reef ecosystems.
- 2) Develop a “semi-coordinated” National network of monitoring sites,
- 3) Facilitate sharing of monitoring information among partners, and
- 4) Fill gaps in local monitoring coverage.

A coordinated coral reef ecosystem monitoring program provides a national assessment capability to track the status and trends of coral reef health, community structure, and condition of US coral reef ecosystems.

2002 National Coral Reef Ecosystem Monitoring Program

Program Partners

- Puerto Rico
- US Virgin Island
- Hawaii (main 8 and NWHI)
- Guam
- American Samoa
- Commonwealth of the Northern Mariana Islands
- State of Florida,
- Members of Freely Associated States

NOAA Complementary Monitoring and Assessment Studies

NOAA/NOS
National Centers for Coastal Ocean Science

Monitoring Themes

Benthic Parameters

- Cover (live, dead, etc.)
- Abundance
- Condition
- Size class distribution
- Indicator species
- Diversity*

Water Quality Parameters

- Nutrients
- Suspended solids
- Chlorophyll
- Turbidity
- Temperature
- PAR

Fishery Parameters

- Abundance & distribution
- Size class distribution
- Indicator species
- Diversity*
- Richness
- Evenness

EXAMPLES

NOAA NOS Biogeography Program Field Activities

Baseline Characterizations of Coral Reefs and Associated Biological Communities around St. John, St. Croix, Southwestern Puerto Rico, and Hawaii

simultaneous collections

Fish Data Collected

- Abundance and Distribution
- Size Structure
- Trophic Dynamics (Gut Content Analysis)
- Habitat Utilization Patterns
- Community Structure (Diversity, Richness, etc.)

Fine-scale Habitat Characterization Data

- Coral Cover and Taxonomy
- Algal Cover and Taxonomy
- Seagrass Cover and Taxonomy
- Physiography
- Disease

Water Quality Data

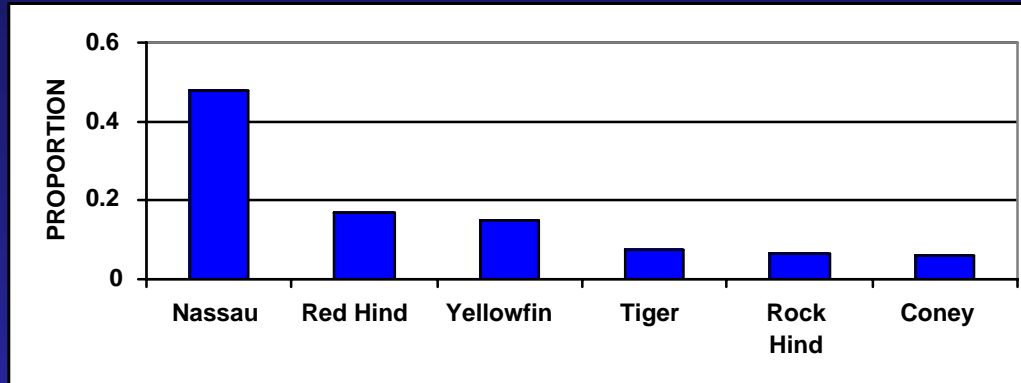

- Temperature
- Salinity
- Turbidity
- Dissolved Oxygen
- Nitrates

Historical Data Analyses

Abundance Comparisons

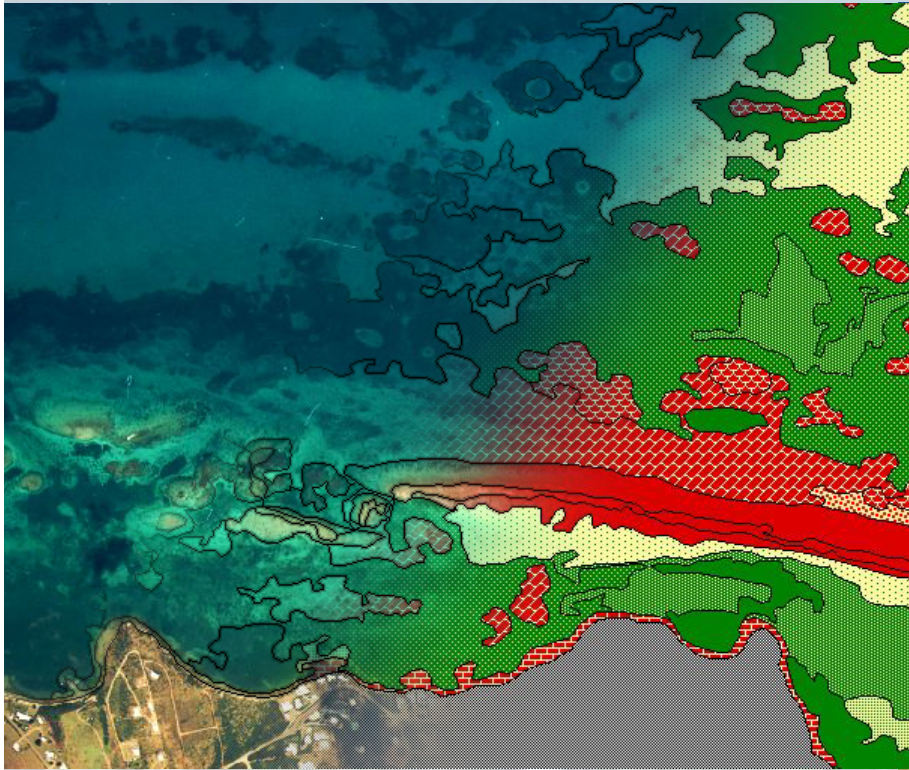

Comparison of the relative abundance of groupers collected by Randall, 1958-1961 around St. John, US Virgin Islands.

Comparison of the relative abundance of groupers observed by J. Beets, 1989-2000 around St. John, US Virgin Islands.

Integration of Mapping, Monitoring & Assessments

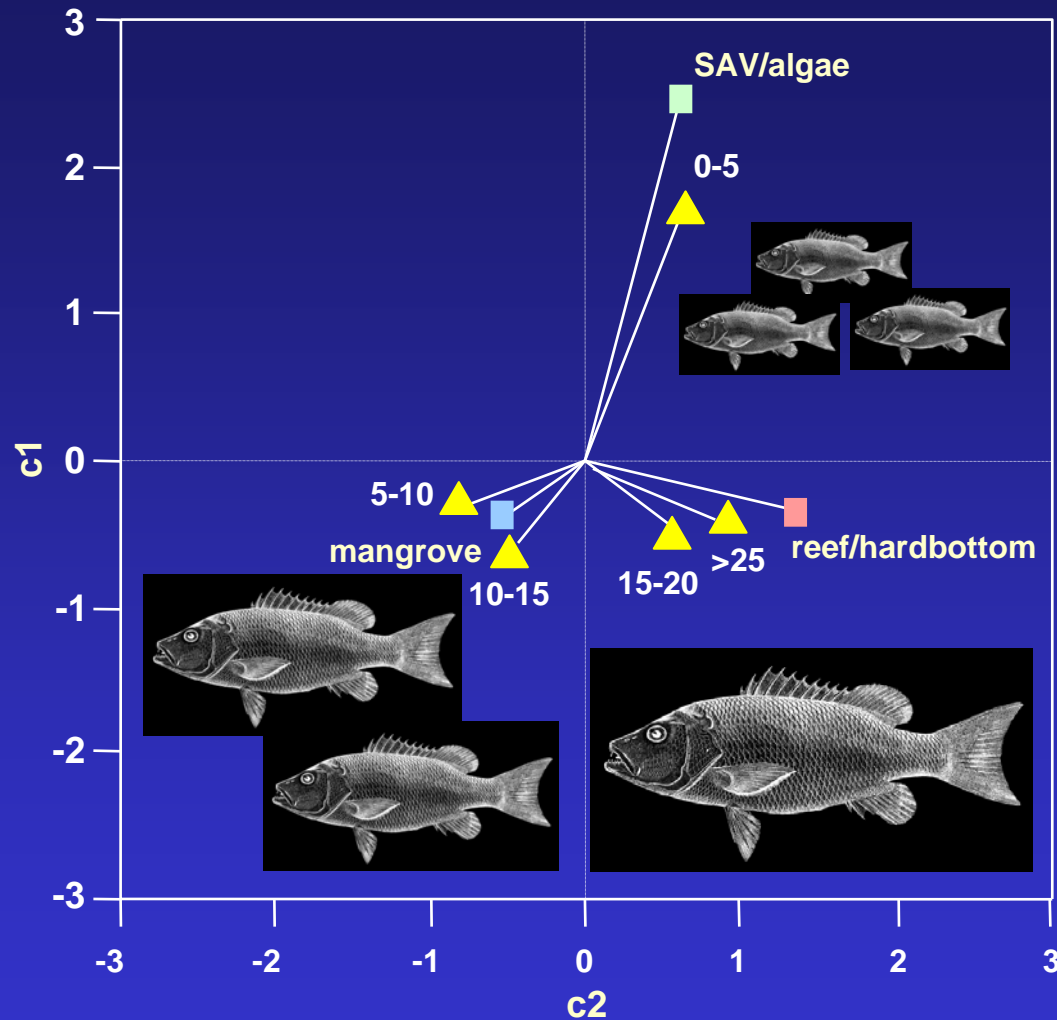

Habitat maps

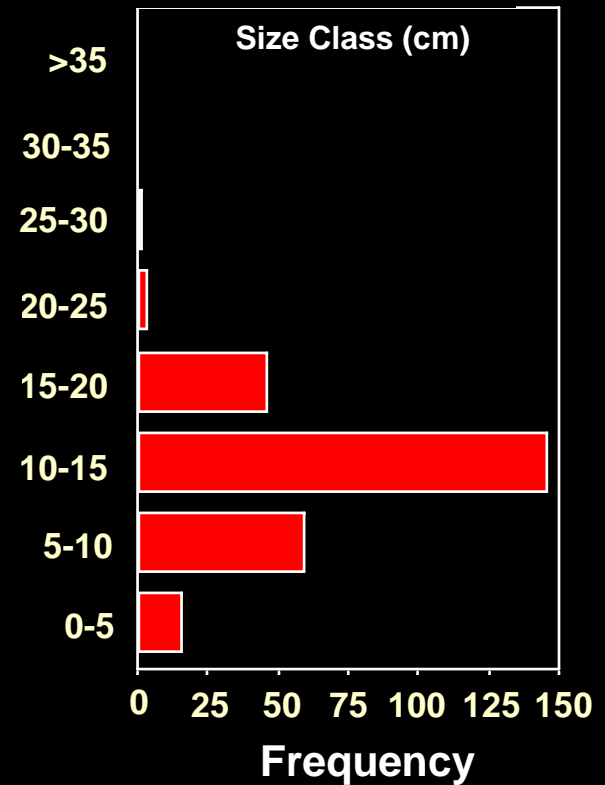

Divers collecting benthic habitat, fish size, and abundance data along a transect.

Gray Snapper Habitat Utilization

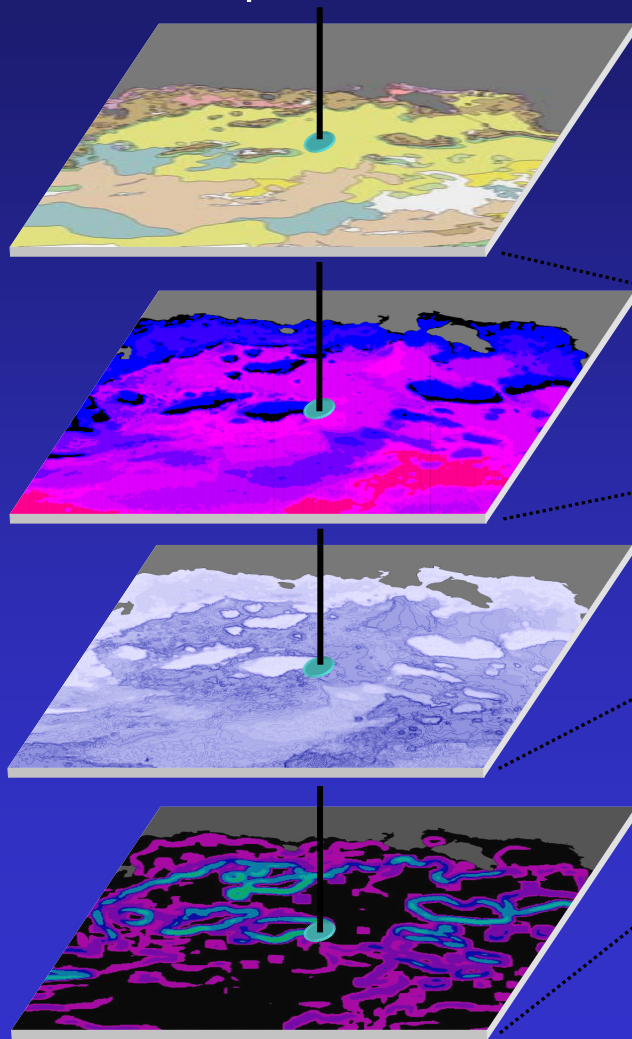

In this example, smaller snappers (0-5cm size class) were observed to select for submerged vegetation, while intermediate sized fishes (5-15cm) selected for mangrove habitats, and the largest size classes (15+ cm) selected for reef structure.

Assessment from Puerto Rico Monitoring

Drill Through Spatial Layers
Example: STATION X

CREATING THE ANALYSIS MATRIX

| STATION | HABITAT | HAB VARIANCE | DEPTH | DEPTH VARIANCE | RICHNESS | DIVERSITY | ABUNDANCE |
|---------|---------|--------------|-------|----------------|----------|-----------|-----------|
| | | | | | | | |

The map shows the island of Puerto Rico with numerous red triangles representing sampling stations. A black circle labeled 'STATION X' is located in the southern part of the island. Dotted lines connect the map to the corresponding rows in the analysis matrix table.

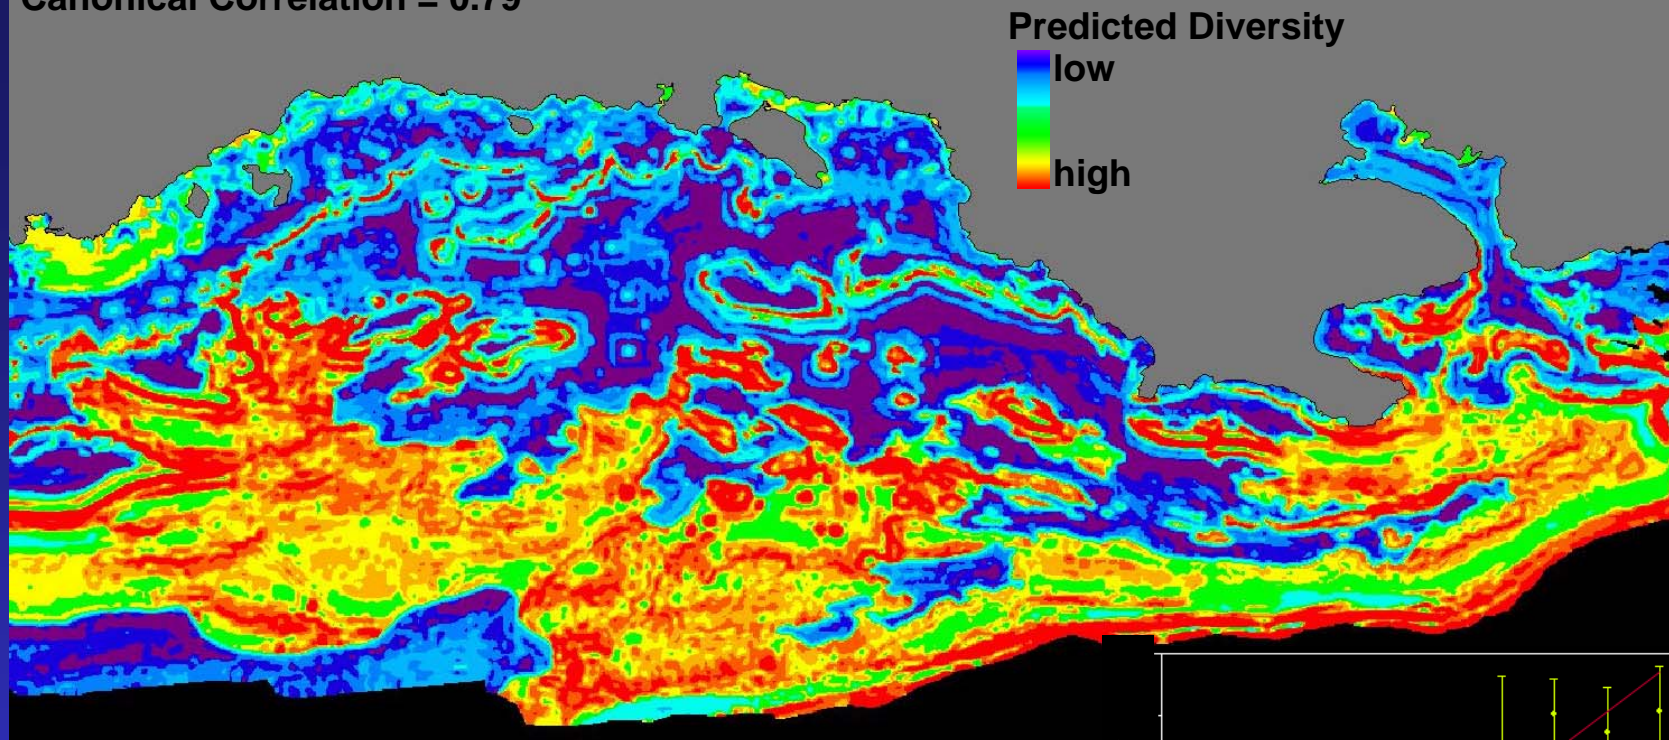

This is Done for the Following Variance Resolutions:

60,100, 200, 300, 500, 1000 m

Base Resolution for all Grids is 20 meters

Results: Southwestern Puerto Rico

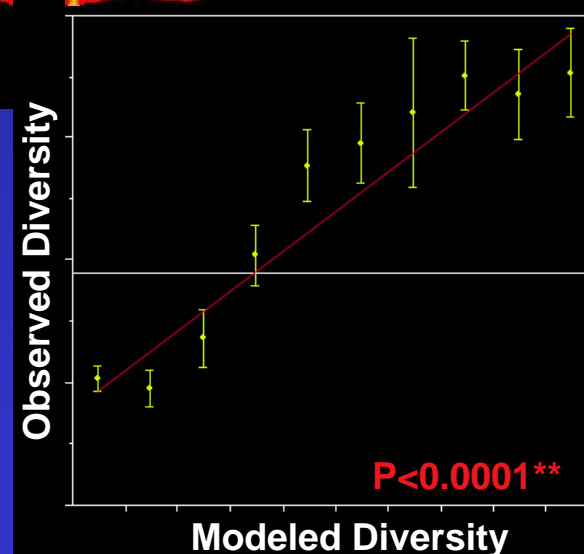

Canonical Correlation = 0.79

This map represents the canonical solution between landscape-level physiographic and fish community structure data.

MAP ACCURACY

OVERALL
0.77
